What happens to our skin as we age
As we age, our skin becomes weaker, resulting in collagen depletion, formation of wrinkles and reduced moisture.

PS helps to maintain healthy, younger-looking skin
Phosphatidylserine (PS), a natural nutrient found in the body’s cell membranes, has been shown to support the skin’s natural defenses, helping keep the skin healthy and youthful-looking.

Clinically proven benefits for skin health
Studies have shown that ingestion of PS promotes the production of collagen, which helps strengthen and protect the skin naturally. Supplementation with PS has been shown to rebalance the skin’s vitality, restore the balance of moisture, refine the skin’s texture and improve overall complexion.

In a clinical study on middle-aged people, daily supplementation with PS for 12 weeks more than doubled the participant’s skin moisture. Intake of PS as a supplement has proven to be safe and free from significant side effects.

PS supplementation was shown to benefit aged skin
In a randomized, double-blind, placebo-controlled study, subjects received 300mg of PS daily for 12 weeks. Eye wrinkles were evaluated by a dermatologist (0 none, 7 very severe).
